Contents

Introduction

Prerequisites

Exercise 1: Create Azure App Service (Web App) from the portal

Exercise 2: Configure Azure App Service Extension

Exercise 3: Create and run ASP.NET Core MVC Application locally

Exercise 4: Deploy the application to Azure App Service

Exercise 5: Modify the application locally and redeploy

Exercise 6: [Self-Study] Deploy the application to a new App Service from VS Code

Azure Web App Lab

Introduction

In this lab, you will create an Azure Web App (App Service) and deploy a sample .NET Core MVC Application created using Visual Studio Code into that Web App. You will then modify the application in VS Code and redeploy it to the Azure Web App. Finally, you will deploy the same application into a new Azure App Service, this time created from VS Code itself.

You'll learn:

- How to create Azure Web App from the portal
- How to deploy an application from VS Code to Azure App Service
- How to create an App Service from VS Code

Prerequisites

The following is required to complete this hands-on lab:

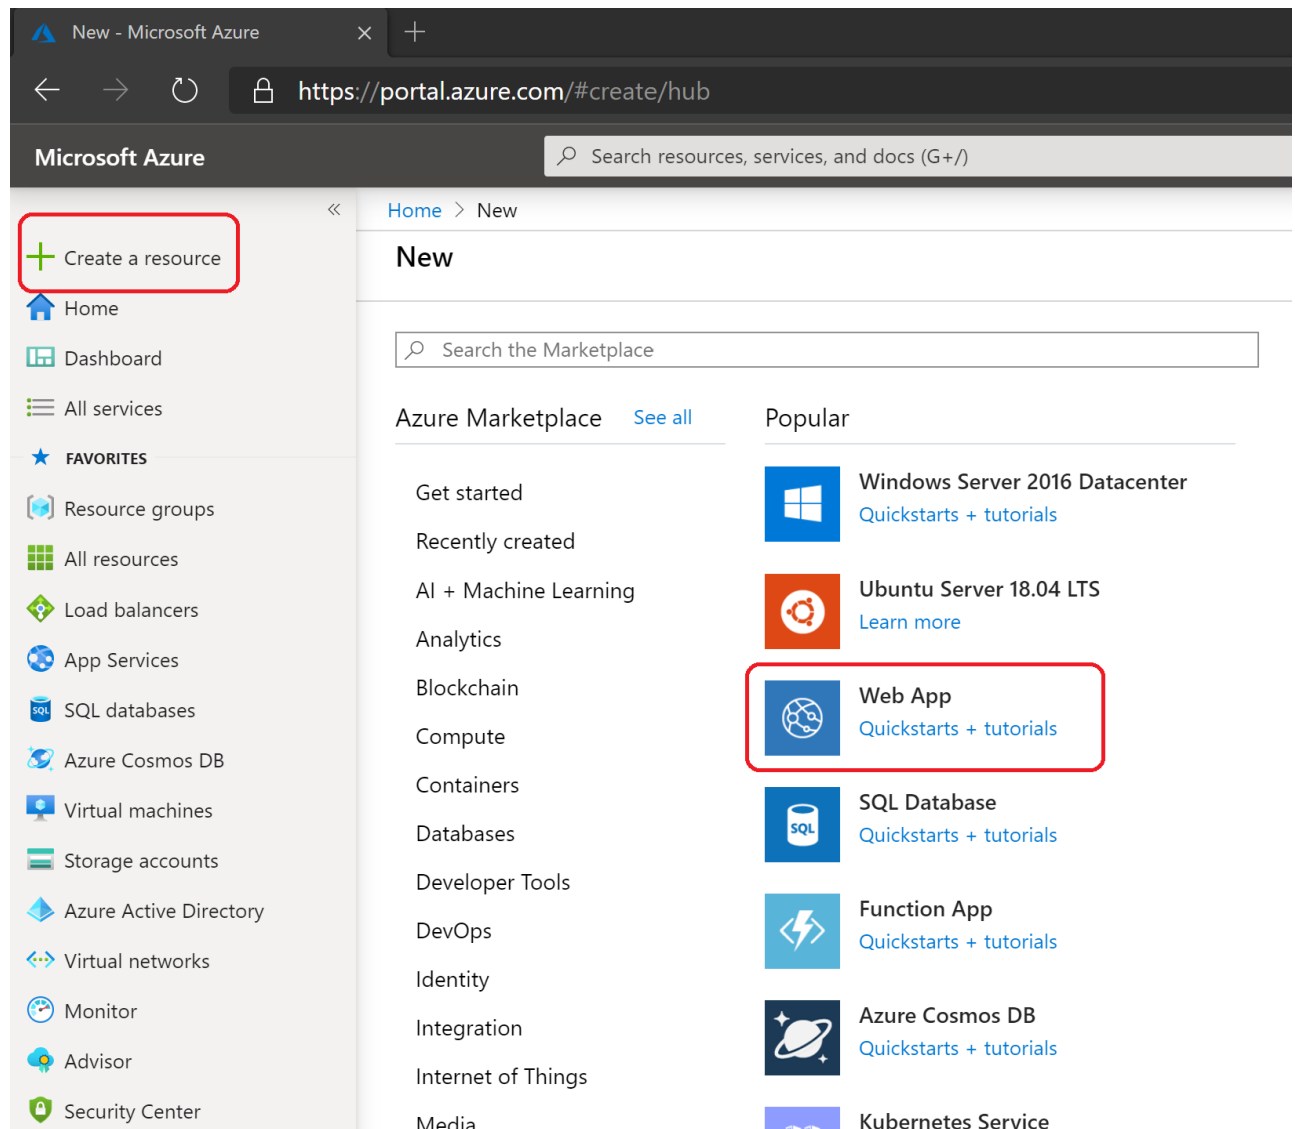

- Microsoft [Visual Studio Code](#) with the C# extension installed
- The [Azure App Service extension](#) for VS Code (installed from within VS Code)

Estimated Time to Complete This Lab

30 minutes

Exercise 1: Create Azure App Service (Web App) from the portal

1. In a browser window, navigate to <https://portal.azure.com>
2. Sign into Azure Portal, click on **Create a resource** and select **Web App**

3. Create a new **Resource Group** named **AzureWebAppLab** (name has to be unique across your subscription)

Web App

Basics Monitoring Tags Review + create

App Service Web Apps lets you quickly build, deploy, and scale enterprise-grade web, mobile, and API apps running on any platform. Meet rigorous performance, scalability, security and compliance requirements while using a fully managed platform to perform infrastructure maintenance. [Learn more](#) 

Project Details

Select a subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription * 

Resource Group *

Runtime stack *

Operating System

Region *

A resource group is a container that holds related resources for an Azure solution.

Name *

AzureWebAppLab 

OK

Cancel

 Not finding your App Service Plan? Try a different region.

4. Create a Web App with following information:

- **Name:** myFirstWebApp-abc (This name has to be unique across all of Azure. Replace abc with your initials to make it unique)
- **Publish:** Code
- **Runtime stack:** .NET Core 3.0
- **Operating System:** Windows
- **Region:** East US
- **Windows Plan:** Create New and name it newASP
- **Sku and size:** Standard S1

Sku and size * **Standard S1**

[Review + create](#) [< Previous](#) [Next : Monitoring >](#)

5. Click on **Review + create** and once the validation is complete, click on **Create**

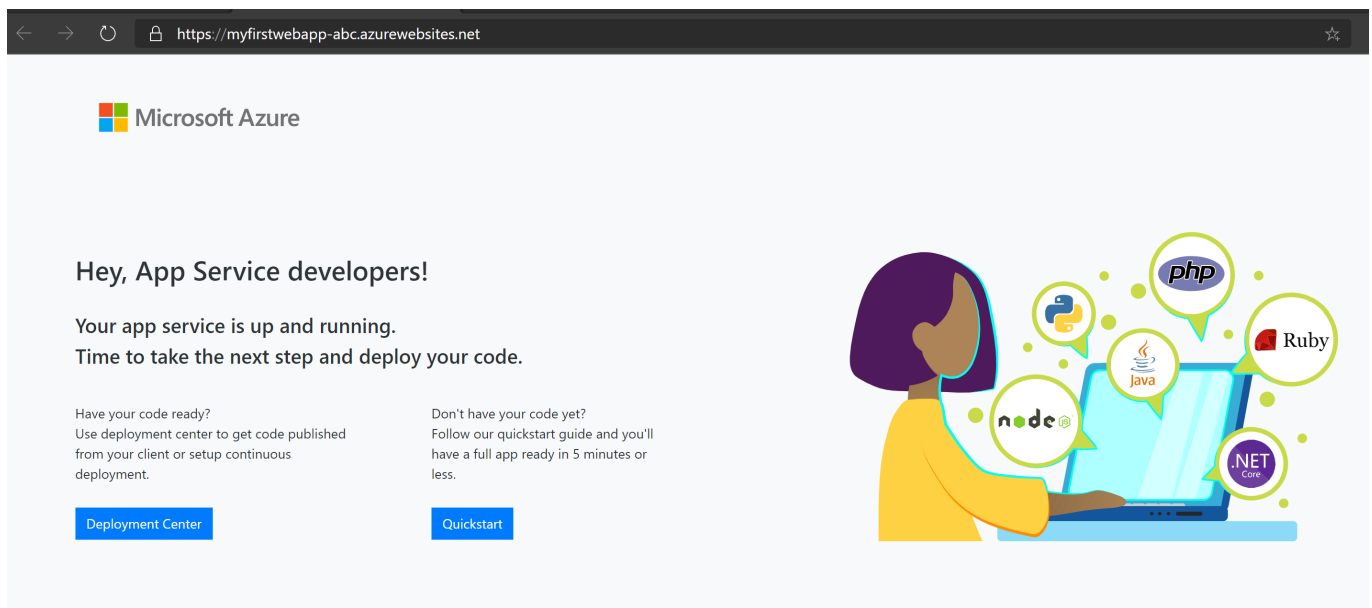

6. Once the Web App gets created, it will show up in the resource group

Filter by name...	Type == all ⓘ	Location == all ⓘ	+ Add filter
Showing 1 to 3 of 3 records. <input type="checkbox"/> Show hidden types ⓘ No			
<input type="checkbox"/> Name ↑↓	Type ↑↓	Location ↑↓	
<input type="checkbox"/> myfirstwebapp-abc	App Service	East US	
<input type="checkbox"/> myfirstwebapp-abc	Application Insights	East US	
<input type="checkbox"/> newASP	App Service plan	East US	

- Click on the App Service (web app) that you just created
- Click on **Browse** or on the URL for the app that was created

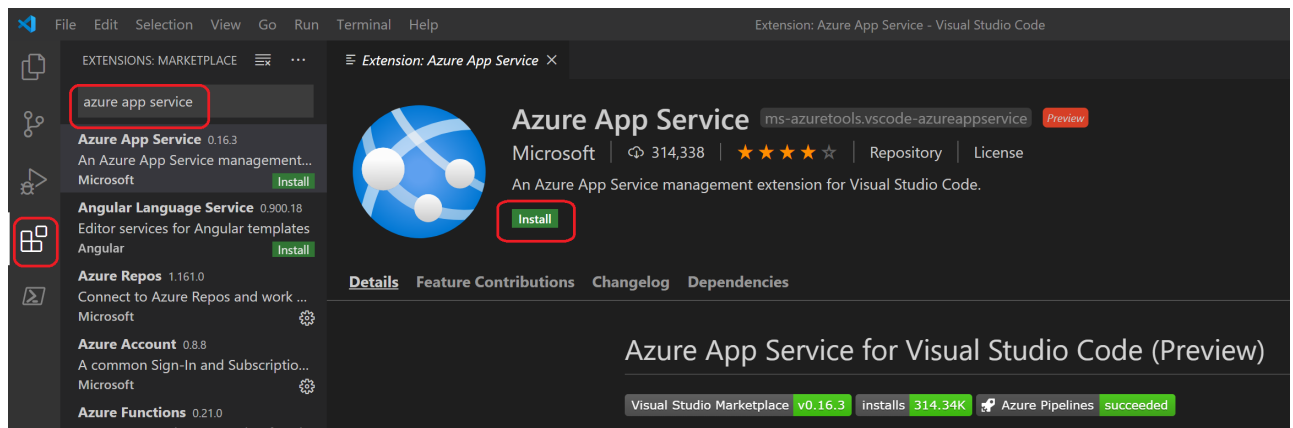

Note: At this time we have created an empty app that doesn't have any code in it. In the next exercises we will deploy the code in it.

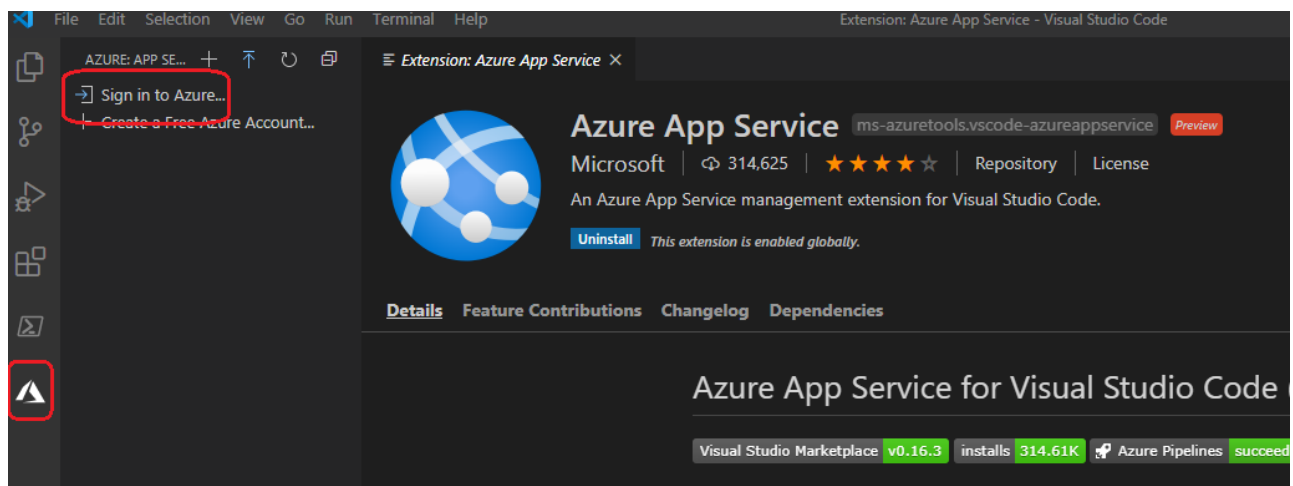

Exercise 2: Configure Azure App Service Extension

1. Open Visual Studio Code.
2. The Azure App Service extension provides convenient way to manage Azure App Service from Visual Studio. If you haven't installed it already, from the **Extensions** tab, search for "**Azure App Service**" and click **Install** to install it.

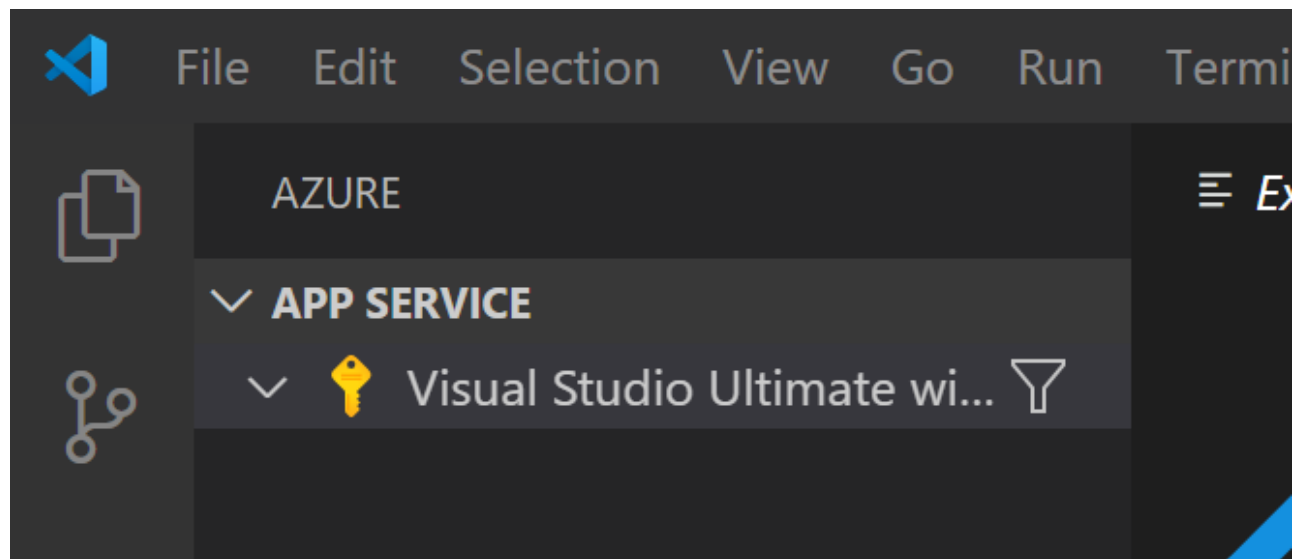

3. Click **Reload** once the extension has finished installing. If this option is not available, reopen Visual Studio Code.
4. Click on the Azure Explorer and click **Sign in to Azure**
Note: If you have multiple Azure extensions installed, select the one for the area in which you're working, such as App Service, Functions, etc.

5. After signing in, verify that the email address of your Azure account (or "Signed In") appears in the Status Bar and your subscription(s) appears in the Azure explorer

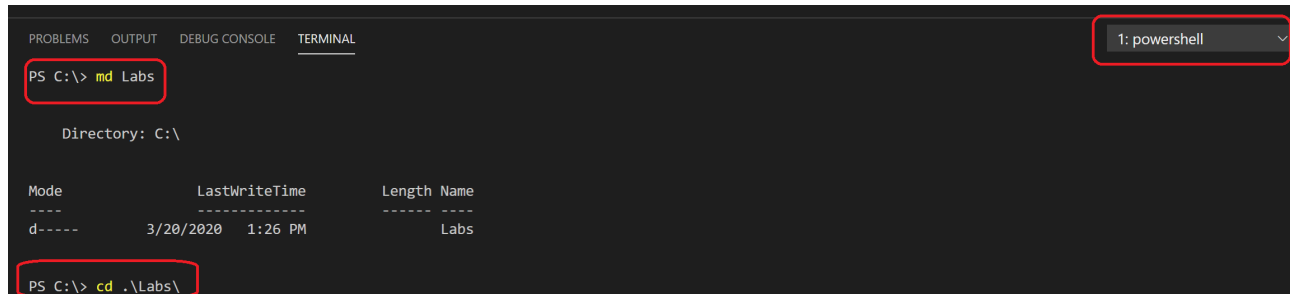

Exercise 3: Create and run ASP.NET Core MVC Application locally

We will use a sample ASP.NET Core MVC Application for this lab. There are several ways create an ASP.NET Core MVC Application. We will use the terminal of VS Code to create this application.

1. Open the **New Terminal (Ctrl + Shift + `)** in Visual Studio Code and switch to Powershell option in the drop-down at the top-right of the terminal window. Switch the root directory of the terminal where you want you to create the website.

The screenshot shows the Visual Studio Code terminal interface. At the top, there are tabs for PROBLEMS, OUTPUT, DEBUG CONSOLE, and TERMINAL. The TERMINAL tab is active. In the top right corner of the terminal window, there is a dropdown menu showing '1: powershell'. The terminal content shows the following commands and output:

```
PS C:\> md Labs

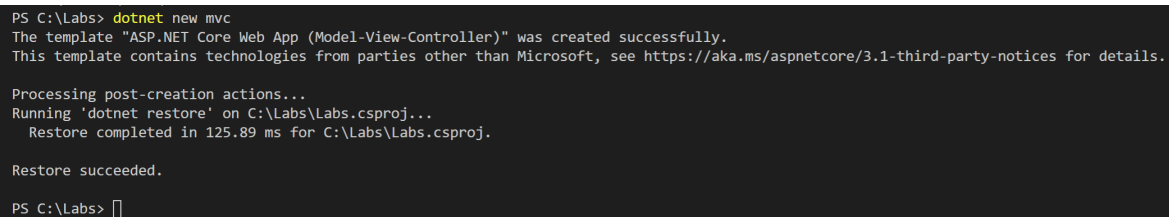

Directory: C:\

Mode                LastWriteTime         Length Name
----                -
d-----          3/20/2020   1:26 PM             Labs

PS C:\> cd .\Labs\
```

2. Execute following Command to create a web app using template ASP.NET Core MVC.

```
dotnet new mvc
```

The screenshot shows the Visual Studio Code terminal with the output of the 'dotnet new mvc' command. The output is as follows:

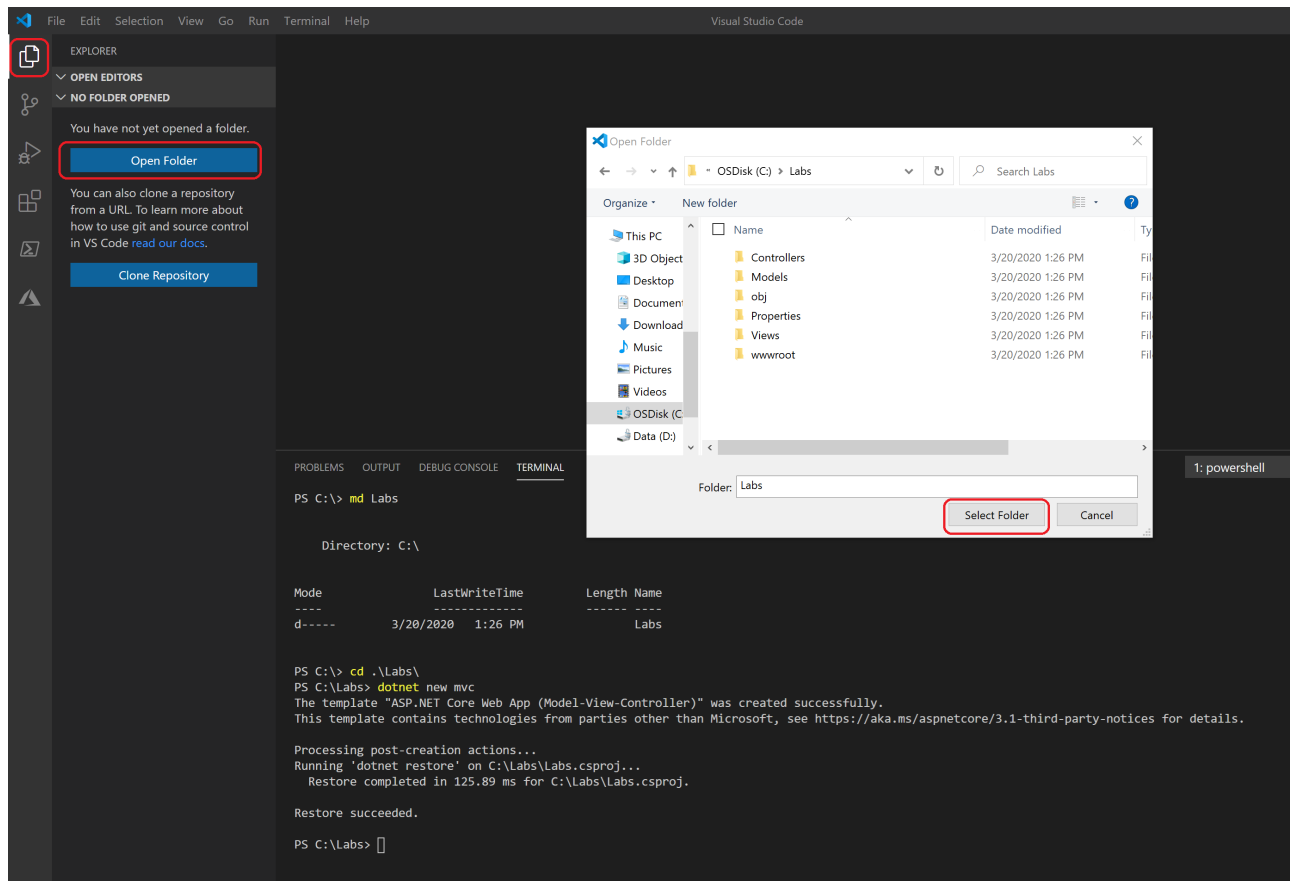

```
PS C:\Labs> dotnet new mvc
The template "ASP.NET Core Web App (Model-View-Controller)" was created successfully.
This template contains technologies from parties other than Microsoft, see https://aka.ms/aspnetcore/3.1-third-party-notices for details.

Processing post-creation actions...
Running 'dotnet restore' on C:\Labs\Labs.csproj...
  Restore completed in 125.89 ms for C:\Labs\Labs.csproj.

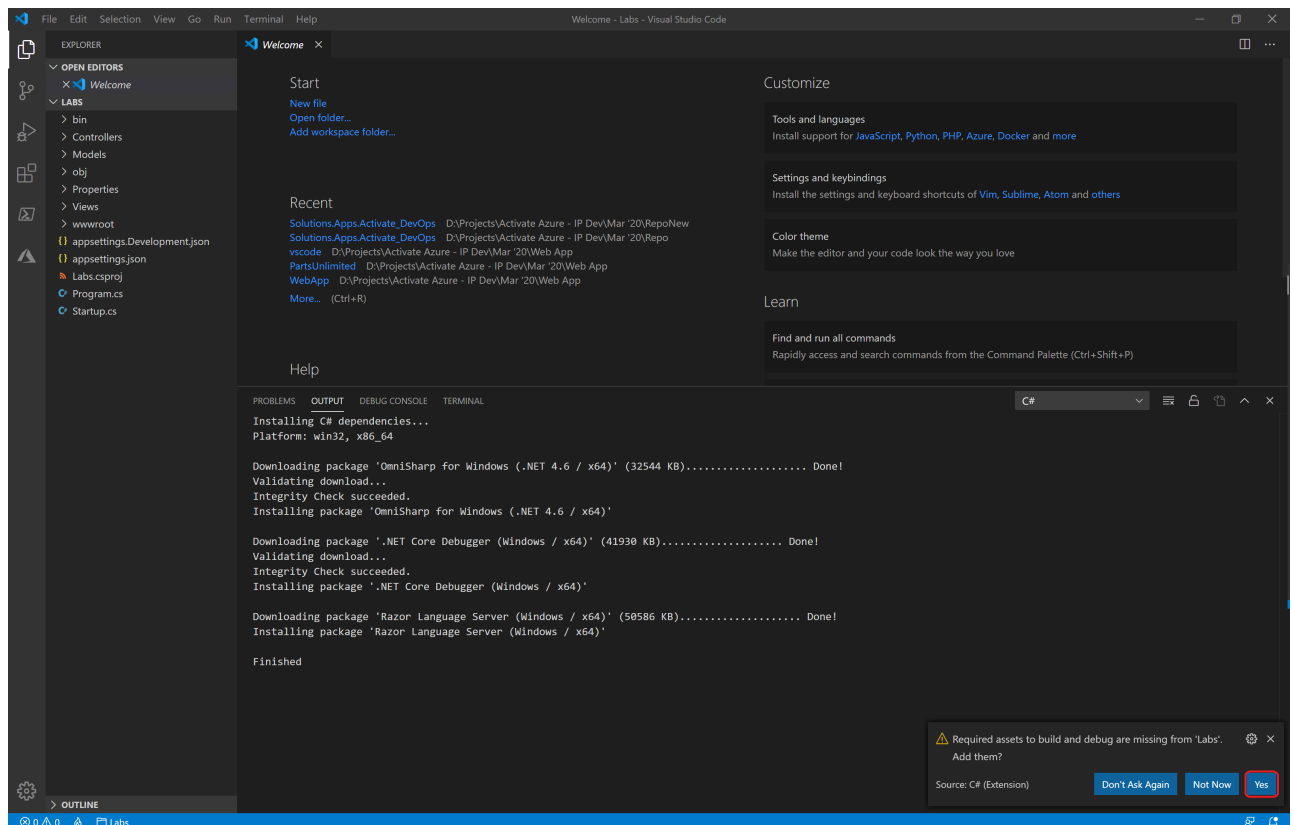

Restore succeeded.

PS C:\Labs>
```

3. Open the application in Visual Studio Code.

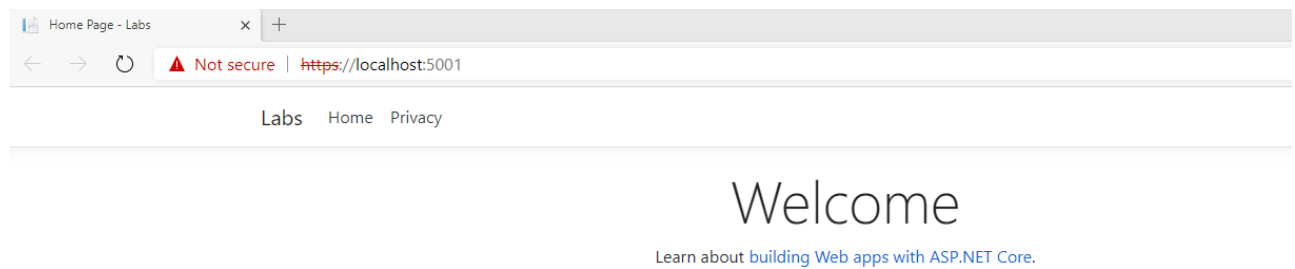

4. After the directory is opened in VS Code, the solution might download required packages and ask add required assets in the solution directory. Click **Yes**

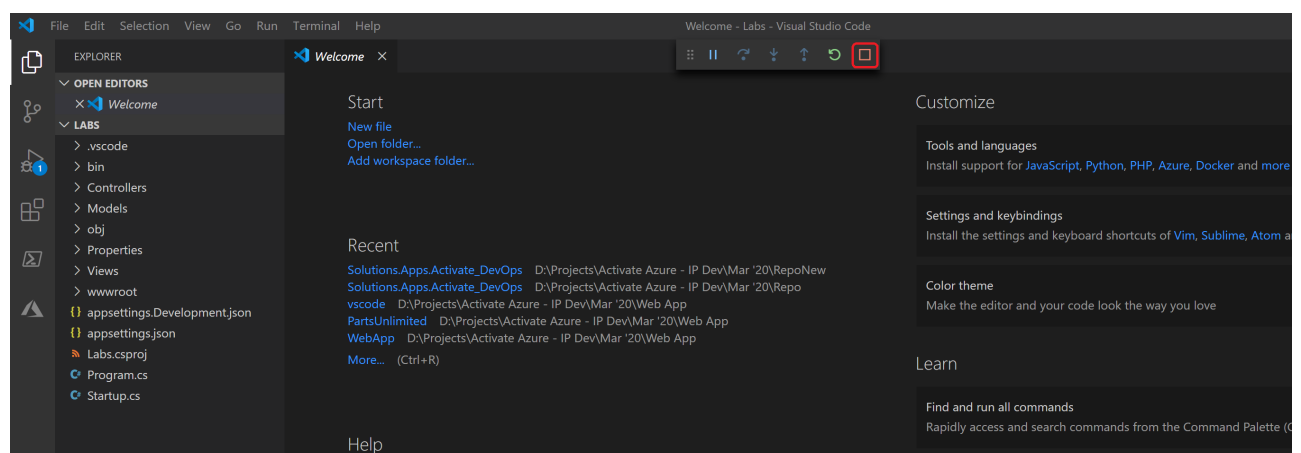

5. Run the application locally. You can do this either by clicking Run option from the left pane of VS Code or by clicking **Run** and selecting **Run without Debugging** or by **Ctrl + F5**

Note: As the application opens in the browser, it might display certificate warning. Accept the warning and continue.

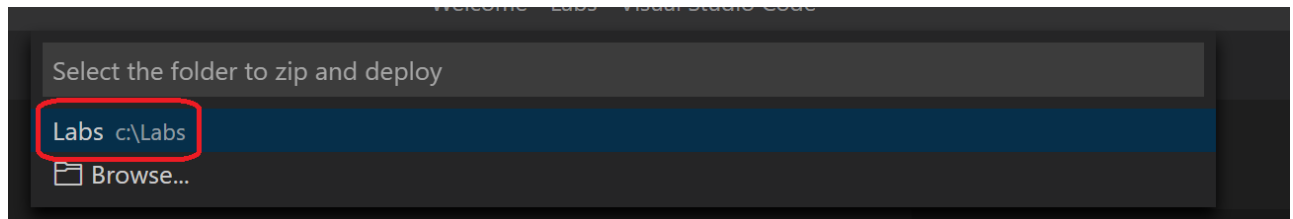

6. After you confirm the application is running locally, stop the session from VS Code.

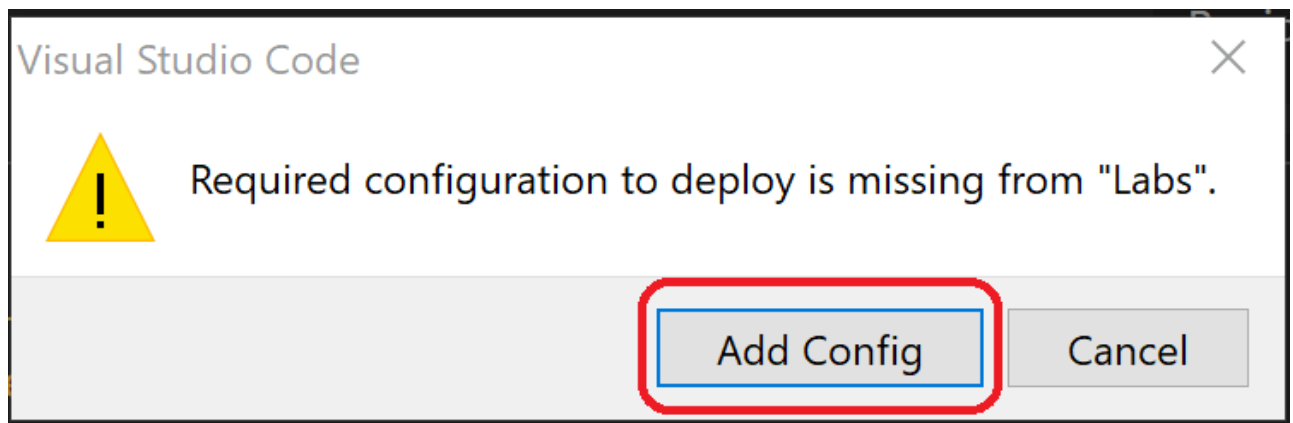

Exercise 4: Deploy the application to Azure App Service

We will now deploy this application to Azure App Service that we created in **Exercise 1**

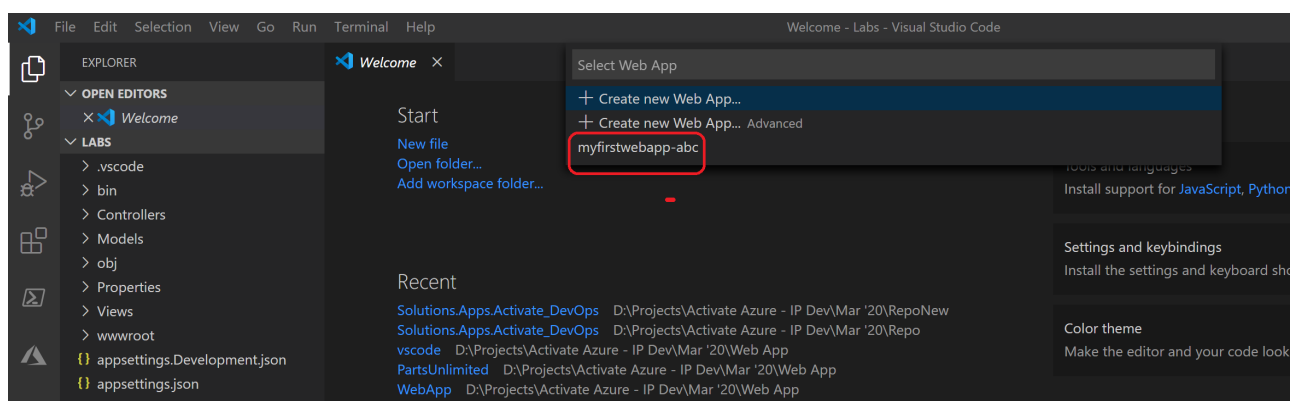

1. From the **command palette (Ctrl+Shift+P)**, type "Deploy to web app" and select **Azure App Service: Deploy to Web App**
2. Select the default folder to zip and deploy the application

3. You may get a prompt asking to add the required configuration to deploy. Select **Add Config**

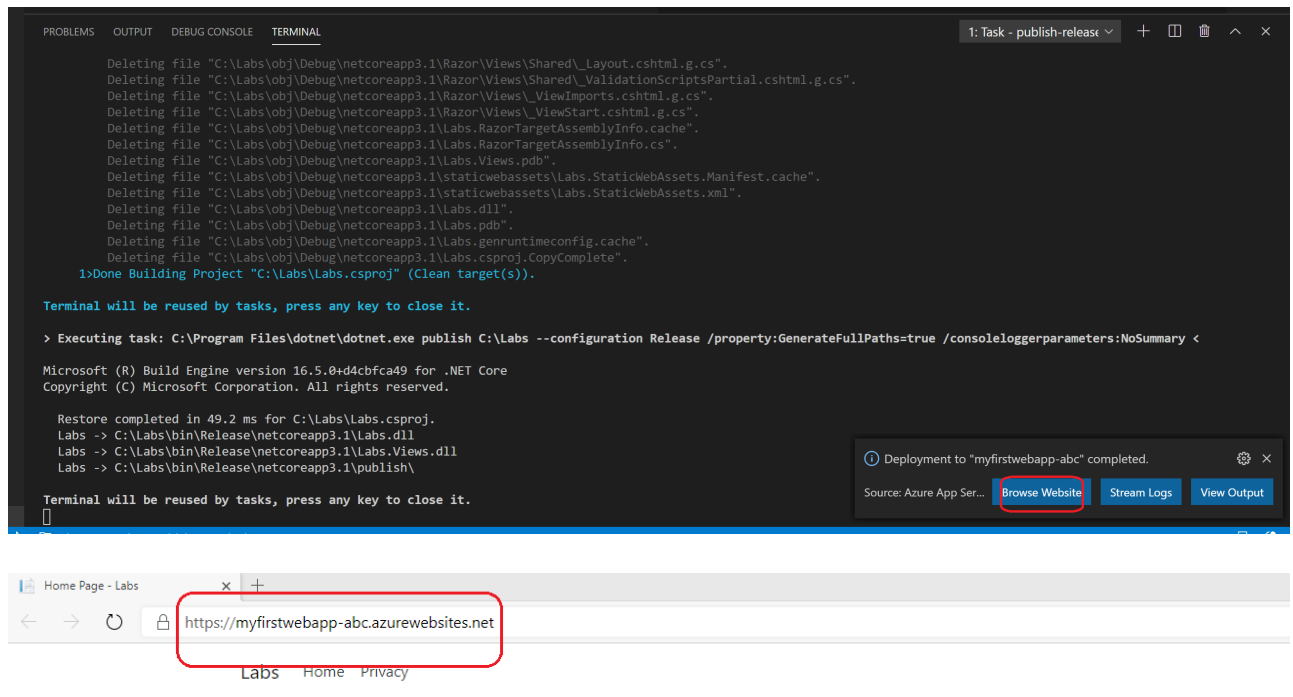

4. In the Command Palette, you should see the Azure App Service you created in Exercise 1. **Select myfirstwebapp-abc**

Note: If it prompts for the overwriting message, **Click Deploy**.

Note: If you are asked to enter the credentials for you Azure Subscription, enter correct credentials.

5. Check the progress of the deployment in the Terminal as well as in the bottom-right of VS Code. After the deployment is complete, **Click Browse Website**

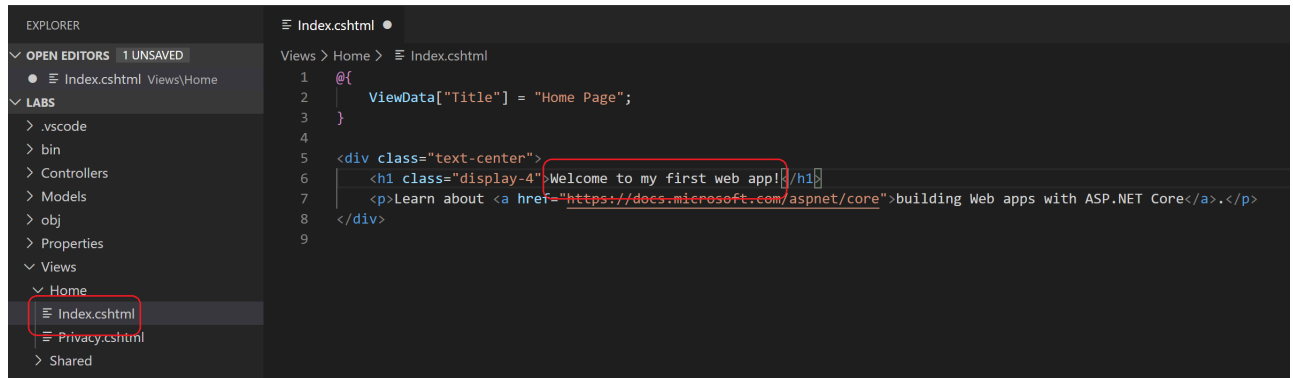

Note: Notice that the URL is <https://myfirstwebapp-abc.azurewebsites.net>. This indicates that this time you are browsing to the site hosted in Azure App Service. Congratulations, your web app is now live in Azure!

Exercise 5: Modify the application locally and redeploy

We will now make a small change in the application locally and then redeploy it to Azure App Service

1. In the explorer in VS Code, navigate to ****Views -> Home -> Index.cshtml**
2. Modify the **Welcome** header to **Welcome to my first web app!**

3. Save the changes (Ctrl + S) and from the **Command Palette (Ctrl + Shift + P)** once more type "Deploy to web app" and select **Azure App Service: Deploy to Web App**
4. Select the same myfirstwebapp-abc App Service again.
5. **Click Deploy** in the prompt asking the confirmation
6. Once the deployment is complete, browse to the application again and you should be able to see the changes you made.

Exercise 6: [Self-Study] Deploy the application to a new App Service from VS Code

In this last exercise we want you to deploy this same application to a different App Service into a different Resource Group. You want to create the required Azure resources from VS Code itself using the same Azure App Service extension.

You can use the names of your choice for the Azure resources (Resource Group, App Service Plan and App Service) you will create.

The steps for this exercise are deliberately not given so that everyone can explore the Azure App Service extension by themselves. Please work with the instructor if you have questions or if you get stuck anywhere.
